

EventAI – An AI Powered Event Planner

Problem Statement:

Event planning is a complex and time-consuming process that involves selecting venues, estimating budgets, managing guest lists, choosing themes, and organizing event schedules. Traditional planning methods often require extensive manual effort and experience, making it difficult for users to create personalized and well-organized events while staying within budget. These challenges can lead to inefficient planning, increased costs, and reduced user satisfaction.

The proposed **AI Event Planner Using Generative AI** addresses these challenges by leveraging **IBM watsonx.ai** and the **Llama Model** to generate intelligent, personalized event plans based on user inputs such as event type, date, location, budget, number of guests, and preferred theme. The system provides AI-generated recommendations for venues, decorations, catering, entertainment, and complete event schedules tailored to individual requirements. This AI-powered solution reduces planning time, minimizes manual effort, improves decision-making, and delivers a seamless event planning experience.

In addition to generating personalized event plans, the system securely stores event history and provides an interactive analytics dashboard that displays key insights such as total events, total budget, average guests, monthly event trends, and event-type distribution. By combining **IBM watsonx.ai**, the **Llama Model**, **Flask**, **SQLite**, **HTML**, **CSS**, and **JavaScript**, the solution offers a scalable, user-friendly, and intelligent platform for modern event management, helping users plan events more efficiently and effectively.
